1. Executive Summary

NCollection ERP is a SaaS ERP Platform built on top of **Odoo 19 Community Edition**. The platform targets small-to-medium businesses (5–100 employees) in the **UAE and GCC** region that cannot afford or do not want to contract with Odoo directly.

The project is **not** building an ERP from scratch. Instead, it leverages Odoo 19 Community as the business engine and builds a **SaaS platform layer** around it — including tenant management, subscription management, module licensing, branding/white-labeling, and UAE localization.

[!IMPORTANT] **Key Insight from the Demo:** After presenting the initial demo to the client (who is the platform owner, not an end-user company), the team realized that the ERP functionality itself is already mature. **The missing piece is the SaaS experience** — tenant provisioning, subscription management, module visibility control, and the customer workspace. This shifted all priorities.

2. Project Vision & Objectives

Vision

Build a subscription-based ERP platform — similar to Odoo's SaaS offering — that NCollection can sell to businesses in the UAE and GCC. Every subscribing company gets its own isolated workspace with only the modules they've paid for.

Primary Objectives

#	Objective	Priority
1	Deliver a production-ready Customer Workspace where subscribers land directly in their ERP	P0 — Immediate
2	Build Subscription & Tenant Management so NCollection can provision new clients	P0
3	Implement Module Visibility Control tied to subscription plans	P0
4	Complete NCollection Branding (remove all Odoo references)	P1
5	Deliver UAE Localization (VAT 5%, AED currency, Arabic/English, invoice templates)	P1
6	Implement Financial Reporting via OCA modules (General Ledger, Trial Balance, P&L, Balance Sheet)	P1
7	Build SaaS Automation (auto-provisioning, billing, renewals, backups)	P2
8	Add Executive Dashboards, AI Layer, Customer Portal, and Mobile	P3+

3. Business Model & Target Market

Target Market

- **Geography:** United Arab Emirates (UAE) and GCC countries
- **Company Size:** 5–100 employees
- **Industries:** Trading, distribution, import/export, food industries, services, small manufacturing

- **Pain Points:** Cannot afford Odoo Enterprise; need Arabic/English support; need local VAT compliance; need quick onboarding

Business Model: Subscription SaaS

NCollection (Platform Owner)

- Company A (Subscriber) → client-a.ncollectionerp.com
- Company B (Subscriber) → client-b.ncollectionerp.com
- Company C (Subscriber) → client-c.ncollectionerp.com

Revenue Streams

Stream	Description
Monthly/Annual Subscriptions	Tiered plans (Starter, Business, Enterprise)
Implementation Fees	Setup, configuration, data migration
Customization Fees	Client-specific module development
Training	User and admin training sessions
Support	Ongoing technical support packages
Hosting	Cloud infrastructure management

4. Product Architecture Overview

```

    D --> H
    H --> I & J & K & L & M & N & O
```

5. Two-Layer Architecture

[!IMPORTANT] **Development Rule #2:** Always think in two layers. Never mix responsibilities.

Layer 1: Platform Layer (NCollection SaaS)

Everything related to running the **business of selling ERP**:

- Tenant provisioning & isolation
- Subscription plans & billing
- Module licensing & visibility
- Platform admin dashboard
- Customer onboarding
- Backup management
- Domain management

Layer 2: ERP Layer (Odoo 19 Community)

Everything related to the **ERP functionality itself**:

- CRM, Sales, Purchase, Inventory
- Invoicing / Accounting
- HR, Projects
- Reports
- UAE Localization

6. Technical Stack & Infrastructure

Software Stack

Component	Technology	Notes
ERP Engine	Odoo 19 Community	Source code from GitHub, not Docker image (for full control during development)
Database	PostgreSQL 16	Running in Docker container
Containerization	Docker + Docker Compose	Used from Day 1 for dev/staging/production parity
Version Control	Git + GitHub	Private repo: NCollection-Sys/ncollection-erp
CI/CD	GitHub Actions	Auto-build, test, deploy on push to <code>develop</code>
DB Admin	pgAdmin	Running in Docker for development
Web Server	Nginx	Reverse proxy (production)
IDE	VS Code	Extensions: Python, Docker, GitLens, XML, PostgreSQL
OS (Dev)	Windows 11 + WSL2	Docker Desktop with WSL2 backend
AI Assistant	Claude (Antigravity)	Implementation partner — follows project rules

Infrastructure Architecture

Development (Local PC/Laptop)

↓ git push

GitHub Repository

↓ GitHub Actions CI/CD

Staging Server (Hetzner VPS)

↓ Manual promotion

Production Server

Recommended Production VPS

Provider	Specs	Purpose
Hetzner Cloud	4 vCPU, 8GB RAM, 80-160GB SSD, Ubuntu 24.04	Development/Staging initially, Production later

[!WARNING] Shared hosting (e.g., Hostinger Shared) is **not suitable** for this project. Docker, PostgreSQL, and multi-tenant Odoo require a VPS or dedicated server.

Project Directory Structure

```
D:\Projects\  
├── odoo19/ # Odoo 19 Community source (NOT modified)  
│   └── (original Odoo code)  
└── ncollection-erp/ # Our project repository  
    ├── custom_addons/  
    │   ├── ncollection_branding/  
    │   ├── ncollection_subscription/  
    │   ├── ncollection_tenant_manager/ (planned)  
    │   ├── ncollection_uae/ (planned)  
    │   ├── ncollection_saas/ (planned)

Docker Compose Services

```
services:  
  db: # PostgreSQL 16  
  odoo: # Odoo 19 (from source code during dev, image for production)  
  pgadmin: # Database management UI  
  # nginx: # To be added for production  
  # redis: # Optional, for caching
```

7. Custom Modules (NCollection Addons)

These are the **core intellectual property** of the NCollection platform.

7.1 `ncollection_branding` — White-Label Module

Status:  Implemented (partial — pending items remain)

Feature	Status
Replace Odoo logo with NCollection logo	 Done
Custom Login page	 Done
Custom Favicon	 Done (needs polish)
Custom color scheme	 Done

Remove Odoo references from UI	☐ Pending
URL branding (/odoo → custom)	☐ Pending
About dialog replacement	☐ Pending
Email template branding	☐ Pending

7.2 `ncollection_subscription` — Subscription Management

Status: ☒ Implemented (core models, views, security, demo data — see DELIVERABLE_1 §1.2; business-logic enhancements tracked as P1-T07)

Purpose: Define and manage subscription plans that control what modules each tenant can access.

Models:

- `Subscription Plan` — Starter, Business, Enterprise (name, price, modules included, user limits)
- `Subscription` — Links a tenant/company to a plan with start/end dates, status
- `Module License` — Maps available Odoo modules to subscription tiers

Key Features:

- Create/edit subscription plans
 - Activate/deactivate subscriptions
 - Set expiration dates
 - Choose which modules are enabled per plan
 - Billing integration (future)
 - Trial accounts support
-

7.3 `ncollection_tenant_manager` — Tenant Management

Status: ☒ Superseded — tenant management was implemented inside `ncollection_subscription` (the `ncollection.tenant` model); a separate module is no longer planned. Provisioning automation lives in `ncollection_saas` (Phase 2).

Purpose: Manage isolated customer environments.

Key Features:

- Create new tenant (company + database or company isolation)
 - Assign subscription plan to tenant
 - Suspend/resume tenant
 - Delete tenant
 - View tenant status and usage
 - Tenant-level backup/restore
-

7.4 `ncollection_uae` — UAE Localization

Status: ☐ Planned (Phase 3)

Key Features:

- UAE VAT (5%) configuration
 - AED as default currency
 - Multi-currency support
 - Arabic/English bilingual interface
 - UAE invoice templates
 - UAE Chart of Accounts
 - Local tax reporting formats
 - Document formatting for GCC standards
-

7.5 `ncollection_saas` — SaaS Platform Administration

Status: ☐ Planned (Phase 2)

Purpose: The administrative backend for NCollection platform operators.

Key Features:

- Customer management dashboard
 - Plan management
 - Subscription lifecycle management
 - Module activation/deactivation per tenant
 - License management
 - Provisioning orchestration
 - Domain management (subdomains per tenant)
-

7.6 `ncollection_mis_templates` — Financial Report Templates

Status: ☒ Implemented

Purpose: Custom MIS Builder templates providing:

- Balance Sheet
- Profit & Loss

Built on top of OCA's MIS Builder framework.

8. OCA Community Modules

The following OCA (Odoo Community Association) modules have been integrated:

Installed OCA Modules

Module	Source Repository	Purpose
account_financial_report	OCA/account-financial-reporting (branch 19.0)	General Ledger, Trial Balance, Journal Ledger, VAT Report, Open Items, Aged Partner Balance
mis_builder	OCA/mis-builder	Framework for custom financial reports (Balance Sheet, P&L)

Planned OCA Modules (Post-MVP)

Module	Repository	Purpose
account-financial-tools	OCA/account-financial-tools	Advanced accounting utilities
account-invoicing	OCA/account-invoicing	Enhanced invoicing features
account-payment	OCA/account-payment	Payment processing extensions

9. ERP Module Inventory (Odoo 19 Community)

Available & Installed (Core ERP)

Module	Status	Notes
CRM	✓ Installed	Leads, Opportunities, Customers
Sales	✓ Installed	Quotations, Sales Orders
Purchase	✓ Installed	RFQ, Purchase Orders, Vendors
Inventory	✓ Installed	Multi-Warehouse, Stock Movements, Lots/Serial Numbers
Invoicing (account)	✓ Installed	Customer Invoices, Vendor Bills, Journal Entries, Payments
HR	✓ Installed	Employees, Departments, Contracts
Projects	✓ Installed	Projects, Tasks, Kanban
Manufacturing (MRP)	Available	BOMs, Work Orders, Production Planning
Maintenance	Available	Maintenance Requests, Equipment
Website Builder	Available	Basic website builder
E-Commerce	Available	Basic online store

NOT Available in Community (Enterprise Only)

Module	Alternative
account_accountant (Full Accounting)	OCA Financial Reporting + MIS Builder
Payroll (official)	OCA Payroll modules

Documents Management	TBD
Helpdesk	TBD
Studio	N/A (custom development instead)
Advanced Dashboards	Custom dashboards planned (Phase 4)
Marketing Automation	Future phase

10. SaaS Platform Requirements

10.1 Customer Workspace (Phase 1 — Highest Priority)

The customer experience flow:

Buy Subscription → Receive Tenant → Receive Credentials → Login
→ See only own company → See only licensed modules → Start using ERP

Epic 1: Customer Authentication

- Customer Login with email/password
- Forgot Password / Reset Password
- Session Management
- Remember Me
- Email Verification

Epic 2: Tenant Isolation (Critical)

Every customer must **only** access:

- Own company data
- Own users
- Own reports
- Own attachments
- Own API calls
- **Zero tenant leakage**

Epic 3: Workspace Experience

- After login, customer lands **directly in ERP**
- Customer should **never** see SaaS administration screens
- No visibility into: Organizations, Plans, Provisioning, Subscriptions, Module Manager, Platform Settings

Epic 4: Module Visibility

- Modules displayed according to subscription tier

- Automatic enforcement — no manual toggle per customer
- Example: Starter sees CRM + Sales + Invoices; Professional adds Inventory + Purchase; Enterprise sees everything

Epic 5: Customer Dashboard

- Completely different from SaaS admin dashboard
- Widgets: Sales, Receivables, Payables, Cash, Inventory, Tasks, Activities, Approvals, KPIs, Charts, Notifications, Quick Actions

Epic 6: Role Management (Per Tenant)

Pre-defined roles within each tenant:

Role	Description
Owner	Full control, billing access
CEO	All modules, read-only financials
Manager	Department-level access
Sales	CRM, Sales, Invoicing
Warehouse	Inventory, Purchase
HR	HR module
Accountant	Accounting, Reports
Employee	Limited self-service

Epic 7: Company Branding (Per Tenant)

Each subscribing company can configure:

- Logo, Primary/Secondary Colors
- Reports Logo, Invoice Logo, Portal Logo
- Favicon, Login Background
- Company Email, Company Website

11. Subscription Plans & Pricing Model

Plan Tiers

Plan	Modules Included	Target
Starter	CRM, Sales, Invoicing	Freelancers, micro-businesses
Business / Professional	+ Inventory, Purchase	Small trading/distribution companies

Enterprise	All modules + Custom Reports + E-Invoice + Accounting	Medium businesses needing full ERP
------------	---	------------------------------------

Pricing Model (TBD by NCollection)

- Monthly subscription (recurring revenue)
- Per-user pricing possible
- Annual discount option
- Trial accounts (time-limited)
- Implementation/setup fees separate

12. Multi-Tenant Architecture

Chosen Model: Database-per-Tenant

```
client1.ncollectionerp.com → Database: client1_db
client2.ncollectionerp.com → Database: client2_db
client3.ncollectionerp.com → Database: client3_db
```

Benefits

- **Complete data isolation** between tenants
- Independent backups per tenant
- Independent updates/migrations
- No risk of data leakage
- Easier compliance and auditing
- Follows the same model as Odoo.com

How Odoo Supports This

- A single Odoo instance can serve multiple databases
- Users are routed to the correct database via subdomain
- Odoo's built-in `--db-filter` parameter enables this

13. Branding & White-Label System

Goal

The end user (subscribing company) should **never** see any reference to Odoo. Everything should appear as **NCollection ERP**.

Elements to Rebrand

Element	Original	Target
Login Page	Odoo logo + styling	NCollection logo + branding
Dashboard Header	"Odoo"	"NCollection ERP"
Favicon	Odoo icon	NCollection icon
Loading Screen	Odoo animation	NCollection animation
Email Templates	Odoo branding	NCollection branding
About Dialog	Odoo copyright	NCollection copyright
URL Paths	/odoo/...	/app/... or custom
PDF Reports	Odoo footer	NCollection footer
Error Pages	Odoo styling	NCollection styling

Legal Note

Using Odoo Community (LGPL) allows rebranding, but the team should review the specific license requirements for attribution in distribution contexts.

14. UAE Localization Requirements

Requirement	Details
VAT	5% UAE VAT on applicable transactions
Default Currency	AED (UAE Dirham)
Multi-Currency	Support for USD, EUR, SAR, etc. with exchange rates
Language	Arabic + English (bilingual interface and reports)
Invoice Templates	Compliant with UAE commercial invoice standards
Chart of Accounts	UAE-standard chart of accounts
Tax Reports	VAT return reports in UAE format
Document Formats	GCC-standard commercial document formatting
Electronic Invoicing	Future — UAE e-invoicing compliance when mandated

15. Development Roadmap (8 Phases)

Phase 1: Customer Workspace ← CURRENT PRIORITY

[!IMPORTANT] This is the foundation for every subsequent phase. Must be completed and stabilized first.

Deliverable	Description
Customer Authentication	Login, forgot password, session management
Tenant Isolation	Data separation, access control
Workspace Landing	Direct ERP access post-login
Module Visibility	Subscription-based module display
Customer Dashboard	Business KPIs, charts, quick actions
Role Management	Per-tenant role definitions
Company Branding	Per-tenant logo/color customization

Phase 2: SaaS Automation

Deliverable	Description
Auto-Provisioning	Create tenant + database automatically
Subscription Automation	Activate, renew, suspend, resume
Billing Engine	Invoice generation for subscriptions
Backup Management	Automated tenant backups
Domain Manager	Subdomain assignment per tenant
Email Automation	Welcome emails, renewal reminders
Scheduler & Queue	Background job processing

Phase 3: ERP Enhancement

Deliverable	Description
CRM improvements	Enhanced lead management
Sales enhancements	Advanced quotation workflows
Purchase improvements	Approval workflows
Inventory enhancements	Advanced stock management

Accounting	Full OCA accounting stack
Projects improvements	Resource planning
HR enhancements	Attendance, leave management
Manufacturing	If market demands it

Phase 4: Executive Dashboards

Dashboard	Target User
CEO Dashboard	Company executives
Finance Dashboard	CFO / Accountant
Sales Dashboard	Sales managers
HR Dashboard	HR managers
Warehouse Dashboard	Warehouse managers
Operations Dashboard	COO

Phase 5: AI Layer

Feature	Description
ERP Assistant	AI-powered chat within ERP
Smart Search	Natural language search across modules
Report Generator	AI-generated reports from natural language
Forecasting	Sales/inventory/cash flow predictions
Recommendations	AI-driven business recommendations
AI Insights	Automated anomaly detection

Phase 6: Customer Portal

Feature	Description
Invoice Portal	Customers view/pay invoices
Order Tracking	Track order status
Payment Gateway	Online payments
Support Tickets	Submit and track support requests
Knowledge Base	Self-service documentation

Phase 7: Mobile

Feature	Description
PWA	Progressive Web App
Android App	Native Android
iOS App	Native iOS
Barcode Scanning	Warehouse operations
Push Notifications	Real-time alerts
Offline Mode	Work without connectivity

Phase 8: Platform Services

Feature	Description
Audit Trail	Complete activity logging
Monitoring	System health and performance
Public API	REST API for integrations
Webhooks	Event-driven integrations
Marketplace	Third-party addon marketplace
Developer SDK	Tools for addon developers

16. Development Rules & Standards

[!CAUTION] These rules must **always** be respected. Violations create technical debt that compounds over time.

Rule 1: Never Modify Odoo Core

Always prefer:

- Custom Addons in `custom_addons/`
- Python class inheritance (`_inherit`)
- OWL component patching
- CSS overrides
- XML view inheritance

Rule 2: Two-Layer Thinking

- **Platform Layer** — SaaS, tenants, subscriptions
- **ERP Layer** — Business modules, reports, workflows
- Never mix responsibilities between layers

Rule 3: Milestone-Driven Development

- Every feature belongs to one milestone
- No random/ad-hoc development
- Everything follows the roadmap

Rule 4: Design Before Code

Before writing code, always define:

1. Business Goal
2. User Flow
3. Models (database)
4. Views (UI)
5. Permissions (access rules)
6. Acceptance Criteria

Rule 5: Maintain Upgrade Compatibility

- No hacks or fragile overrides
- No breaking changes
- Must be able to upgrade Odoo version without rewriting custom modules

Rule 6: Odoo Source Code Separation

```
odoo19/      ← Original code, NEVER modified
ncollection-erp/ ← Our repository, all changes here
```

17. Current Project Status

Completed 

Item	Details
Environment Setup	Docker, PostgreSQL 16, Odoo 19, pgAdmin
GitHub Repository	NCollection-Sys/ncollection-erp connected
Docker Compose	Working <code>docker-compose.yml</code> for dev
Branding (Partial)	<code>ncollection_branding</code> — Logo, login page, favicon, colors

Demo Data	"Fresh Origin" demo company with CRM, Sales, Purchase, Inventory, HR, Projects data
OCA Financial Reporting	account_financial_report installed (General Ledger, Trial Balance, Journal Ledger, VAT Report, Open Items, Aged Partner Balance)
MIS Builder	Installed with custom ncollection_mis_templates (Balance Sheet, P&L)
Client Demo	Successfully presented to NCollection client

In Progress

Item	Status
Complete Branding	URL paths, About dialog, email templates pending
Customer Workspace	Next sprint — Phase 1

Not Started

Item	Phase
UAE Localization	Phase 3
SaaS Automation	Phase 2
Executive Dashboards	Phase 4
AI Features	Phase 5
Customer Portal	Phase 6
Mobile Apps	Phase 7

18. Team & Roles

Member	Role	Responsibilities
Omar	Project Owner / Lead Developer	Architecture decisions, client communication, development
Claude / Antigravity	AI Implementation Partner	Module development, code implementation, follows project rules
NCollection Client	Platform Owner / Business Stakeholder	Defines business requirements, approves milestones, will operate the SaaS platform

Claude/AI Collaboration Rules

- Understand the current milestone before coding
- Verify architecture alignment
- Avoid regressions
- Maintain Odoo 19 Community compatibility
- Build features incrementally
- **Do not jump to future phases** until the current milestone is complete

19. Key Architectural Decisions Log

#	Decision	Rationale	Date
1	Build on Odoo 19 Community , not from scratch	15+ years of ERP maturity; faster time-to-market by orders of magnitude	Day 1
2	Odoo 19 (not 18)	Newer UI/UX; longer support lifecycle; starting fresh with no legacy modules	Day 1
3	SaaS model (not on-premise)	Recurring revenue; centralized management; scalable	Day 1
4	Remove all Odoo branding	Platform must appear as NCollection's own product	Day 1
5	UAE/GCC market (not Egypt)	Client's target market; changes localization priorities entirely	Day 1
6	Database-per-tenant (not multi-company)	True isolation; independent backups; follows Odoo.com's model	Day 1
7	Docker from Day 1	Dev/prod parity; reproducible environments; easy deployment	Day 1
8	Never modify Odoo Core	Maintainability; upgrade compatibility; all changes via custom addons	Day 1
9	Source code during dev (not Docker image)	Full control over Odoo internals during development	Week 1
10	OCA Financial Reporting over building custom	Community-maintained; battle-tested; Odoo 19 branch available	Week 1
11	MIS Builder for Balance Sheet / P&L	Flexible report builder; works with Community; custom templates	Week 1
12	Customer Workspace = #1 priority (post-demo shift)	ERP is mature; the SaaS experience is what's missing	Post-demo
13	Hetzner Cloud for VPS hosting	Cost-effective; good performance; EU-based; suitable for initial deployment	Planned
14	GitHub Actions for CI/CD	Integrated with repository; auto-deploy on push to develop	Planned

20. Risks & Constraints

Technical Risks

Risk	Impact	Mitigation
OCA module incompatibility with Odoo 19	Accounting features may break	Always check branch availability; test before installing

Odoo 19 is relatively new	Fewer community resources/examples	Accept trade-off for better UI/UX
Multi-tenant isolation complexity	Data leakage between tenants	Use database-per-tenant; thorough security testing
Performance at scale (many tenants)	Slow response times	Plan for horizontal scaling; monitor early

Business Risks

Risk	Impact	Mitigation
Odoo license compliance	Legal issues	Review LGPL terms; maintain attribution where required
Competition from Odoo.com directly	Market pressure	Differentiate via UAE localization, Arabic support, local pricing, local support
Client expectations vs. development speed	Scope creep	Strict phase-based development; no jumping ahead

Known Unresolved Issues

- Full Accounting (`account_accountant`) is Enterprise-only — using OCA stack as alternative
- `ncollection_branding` still has pending items (URL paths, About dialog, email templates)
- Shared hosting (Hostinger) cannot be used for production — VPS needed
- Some OCA modules may need manual compatibility patches for Odoo 19

21. Acceptance Criteria

Phase 1 (Customer Workspace) — Definition of Done

A subscribing company's experience must satisfy **all** of the following:

- ☐ Company receives a provisioned tenant (even if manually created initially)
- ☐ Company users can log in via `company.ncollectionerp.com`
- ☐ Users land directly in their ERP workspace (not a SaaS admin panel)
- ☐ Users see **only** their licensed modules (based on subscription plan)
- ☐ Users **cannot** access any SaaS administration screens
- ☐ Users **cannot** see or access any other tenant's data
- ☐ Basic role-based access control works within the tenant
- ☐ Tenant can customize their own logo and company information
- ☐ All visible branding says "NCollection ERP" — no Odoo references

[!NOTE] This PRD should be treated as a **living document**. It must be updated after each sprint to reflect new decisions, completed milestones, and evolving requirements. It serves as the **single source of truth** for the NCollection ERP project — replacing scattered chat history and ad-hoc notes.
